

Pet Products

Protecting what matters

Steritech can assist you in opening new opportunities within the global pet food market

At Steritech, we aim to provide a service that can open pathways to new opportunities for our customers.

Our Gamma Irradiation process is regarded around the world as a very effective method to eliminate many different contamination issues, such as E-Coli, Salmonella, mould and insects.

We are a Biosecurity approved treatment provider, meaning our processes can help you comply with Australian import conditions. Our history of treating imported products goes back over 20 years and our staff are highly trained to offer you advice and assistance.

With a reputation as a trusted service provider for exported products, Steritech can help you open new pathways by ensuring product meets the import conditions of the country of destination.

This allows our customers the ability to have full control over the treatment process locally, rather than trying to manage this process overseas.

Whatever your treatment requirements are, Steritech is here to help you protect what matters
