NATURAL SOLUTION FOR HEALTHY TEETH & GUMS, AND FRESH BREATH

Vetnex Natural Dental Care range includes tasty dental chews and a variety of dental powders with the selection of original seaweed, kangaroo and Tasmanian salmon flavours.

Vetnex dental chews are to give as treats which is convenient for busy owners. The dental powders are to be used together with foods (topped or mixed with foods).

DIRECTIONS FOR USE:

Suitable for dogs and cats.

ONCE DAILY or as directed by your veterinarian.

Dental Powders	0.5-3 scoops as detailed on product labels.
Dental Chews	One chew per 5kg body weight.

Vetnex dental range can be used individually or rotationally as part of a longer-term dental health management program for prevention and treatment of plaque, tartar or bad breath or for fussy eaters when they are getting bored with the original seaweed flavour or other products.

NATURAL DENTAL CARE PLAQUE CONTROL

Dental Powders & Dental Chews

- ✓ Reduce Plaque, Tartar & Bad Breath
- ✓ 100% Natural Product

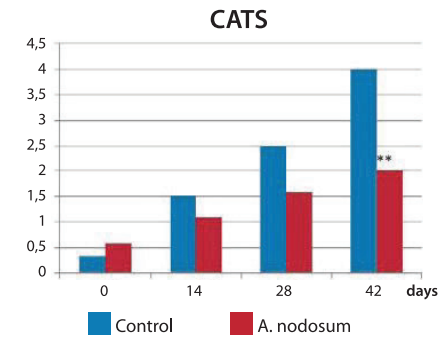

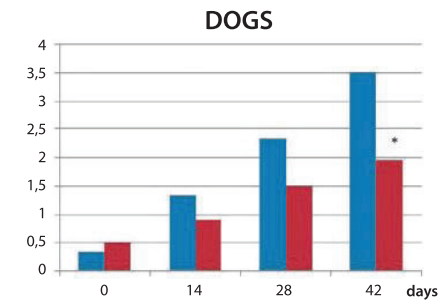

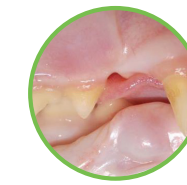

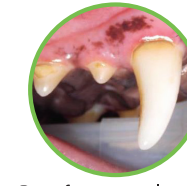

PROTECTION AGAINST PLAQUE, TARTAR & BAD BREATH

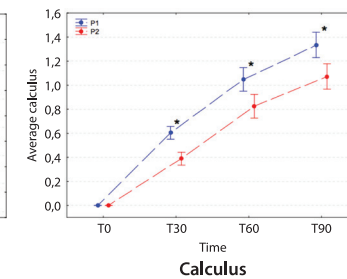

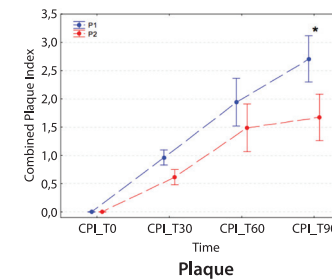

Vetnex Natural Dental Care is a 100% natural product made from organic seaweed *Ascophyllum nodosum*, which is a specific strain of seaweed harvested from the pristine waters near the Arctic Ocean. The seaweed is high in nutrition and has a natural defensive mechanism against bacterial biofilms.

Vetnex Natural Dental Care is orally ingested and works systematically. The natural compounds in the seaweed come out through the saliva to break down the bacterial biofilm, plaque or tartar that forms on the teeth and gums, providing natural protection on the teeth of your pets and helping improve oral health.

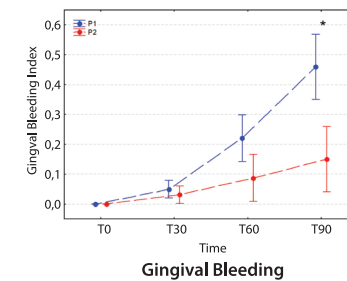

The dental and oral health benefits of the seaweed (*Ascophyllum nodosum*) in dogs and cats have been demonstrated in clinical studies¹⁻².

6-week treatment with seaweed (*Ascophyllum nodosum*) significantly improved Oral Health Index (OHI) in dogs & cats (~50%)

90-day treatment with seaweed (*Ascophyllum nodosum*) dental bites efficiently decreased plaque and calculus accumulation in dogs, and achieved better oral health status than control group
